The Potential Impact of Smart Grid on Customer's Rate Structures

4 hours

Varying power supply costs, pressure to increase city contributions, declining sales and pressure to provide rate structures that promote economic development, energy efficiency, and the impact of smart grid technologies are all affecting how we manage and implement customer rate structures. This program will address new and old rate forms and how utilities should prepare for the future including offering time of use rates, importance of marginal costs, why unbundled rates are necessary, alternative rate mechanism to financially protect revenues when sales are reduced or declining, and different forms of power cost adjustments.
